Current rules: At any junction in a circuit, the total current leaving the junction = total current entering the junction. The junction rule holds because the rates of charge flowing in and out of a junction are always equal. Charge entering the junction = $0.5C$ along wire 1, and the $1C$ along wire 3.

An electric current, I , is the rate at which net charge (ΔQ) flows through a surface area A . Current's units = C/S and often written as A (Ampere). Although current carriers (i.e., charges) could be $+$ or $-$, the direction of current will be in the direction of a $+$ charge flow (i.e., clockwise) $I = \frac{\Delta Q}{\Delta t}$.

PHYSICS

A system of conducting elements that are designed to conduct electric current for a particular purpose is known as an electric circuit. An electric circuit consists of a source of electrical energy; elements that either transform, dissipate, or store this energy; connecting wires. To prevent power overload, circuits often include fuse or circuit breaker. A Short History of Circuits and Systems. The first electric circuit was invented by Alessandro Volta in 1800.
