Sometimes these changes may not be feasible -- a turbo can be a simpler, more compact way to add power, especially for an aftermarket accessory. Turbochargers allow an engine to burn more fuel and air by packing more into the existing cylinders. The typical boost provided by a turbocharger is 6 to 8 pounds per square inch (psi).

prevent turbo lag. Turbo lag is the delay that comes from the engine not responding to the boost acquired from the turbocharger (Nice). Turbine wheels can rotate anywhere between 80,000 and 150,000 revolutions per minute (RPM) (Nice). The turbine wheel is connected to the turbine shaft, and the two are connected by ball bearings or fluid ...

Turbo charger. In 1925 Alfred Buchi, a Swiss engineer, patented a design for the turbo charging with power increase of 40%. First turbo charger were limited to larger engines, such as Marine engines later with trucks engine. Chevrolet corvair and Oldsmobile made the debut. After oil crisis in 1973, it became more acceptable.

How It Works A turbocharger is composed of 3 basic parts, a compressor, a turbine, and a center housing.The turbine is the section of the turbocharger where the exhaust gases of the engine are forced through to cause the turbine wheel to spin.

How a Turbocharger Works

One way to do this is to add cylinders or make the current cylinders bigger. Sometimes these changes may not be feasible -- a turbo can be a simpler, more compact way to add power, especially for an aftermarket accessory. A diesel engine is similar to the gasoline engine used in most cars. Both engines are internal combustion engines, meaning they burn the fuel-air mixture within the cylinders. Both are reciprocating engines, being driven by pistons moving laterally in two directions. The majority of their parts are similar.

Diesel Engine Fundamentals

The turbojet is an airbreathing jet engine, typically used in aircraft.It consists of a gas turbine with a propelling nozzle.The gas turbine has an air inlet, a compressor, a combustion chamber, and a turbine (that drives the compressor). The compressed air from the compressor is heated by burning fuel in the combustion chamber and then allowed to expand through the turbine.

Turbochargers have been used on various petrol engines since 1962, in order to obtain greater power or torque output for a given engine displacement. Most turbocharged petrol engines use a single turbocharger, however twin-turbo configurations are also often used.

Turbocharged petrol engines - Wikipedia

Since non-turbo engines are incapable of producing the substantial low-end horsepower that turbocharged engines produced, non-turbo engines often feature shorter transmission gear ratios to compensate for the lack of horsepower. Shorter gear ratios will make the engine run at a higher average rotations per minute (RPM).
